

## Interactive Mathematical Proof Verification System

Daniel Armaganian, Tzahi Bakal

Supervisors: Dr. Dan Lemberg, Mrs. Elena Kramer

#### Motivation

Background

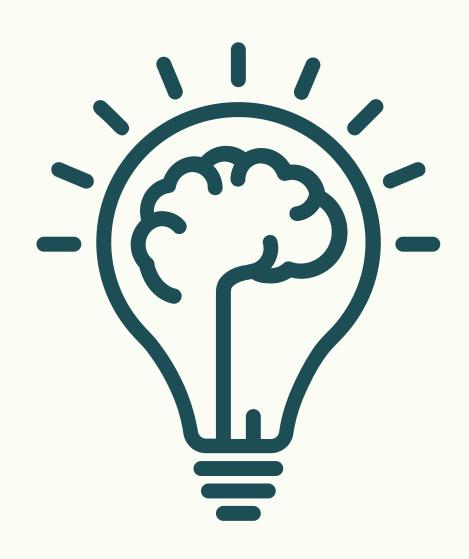

LLMs like ChatGPT, can generate complex mathematical proofs.

**Problem** 

ChatGPT lacks the ability to verify these proofs.

Need

A system to verify Al-generated proofs for accuracy.

#### Introduction

#### **Study Focus**

Address the challenge of verifying ChatGPT-generated mathematical proofs.

#### Methodology

Utilizes ChatGPT's API and Agda's verification based on Intuitionistic and Homotopy Type Theories.

#### **Objective**

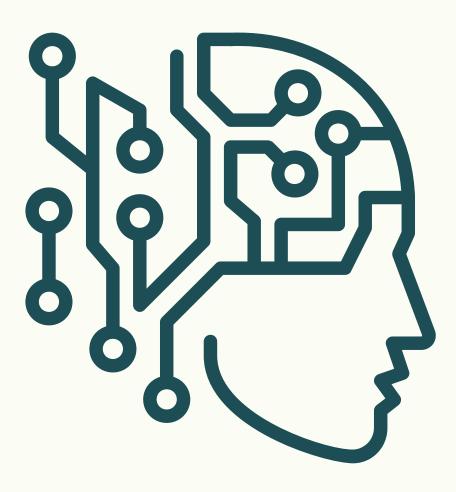

Create a system that verifies proofs generated by ChatGPT, verified through Agda.

#### **Outcome**

A system that reliably verifies ChatGPT-generated mathematical proofs.

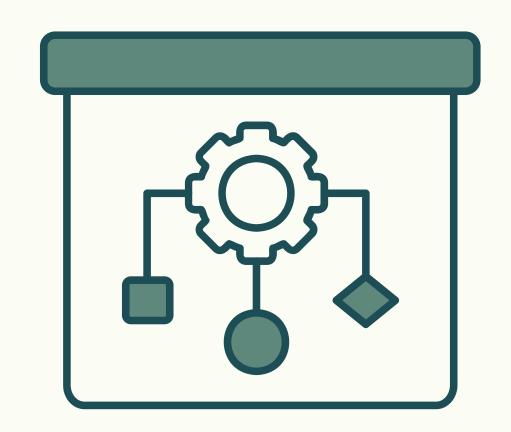

#### Technologies and Theories

- Intuitionistic and Homotopy Type Theories
- ()2) Agda
- 03 ChatGPT

## Intuitionistic and Homotopy Type Theories

- Intuitionistic Type Theory:
  - Treats proofs as algorithms proving something means constructing it step by step.
- Homotopy Type Theory:
  - Simplifies handling complex structures using the Univalence Axiom, treating equivalent objects as identical.

## Agda

- What is Agda?
  - A dependently typed functional programming language
  - Used for writing and verifying formal proofs
- Why Agda?
  - Treats proofs as algorithms
  - Allows complex mathematical structures with precise verification

```
data \mathbb{N} : Set where zero . \mathbb{N} suc \mathbb{N} \to \mathbb{N}
```

$$_{\text{zero}}^{+}$$
  $\mathbb{N} \to \mathbb{N} \to \mathbb{N}$   
 $\text{zero}$   $\text{n = n}$   
 $\text{suc m}$   $\text{n = suc (m + n)}$ 

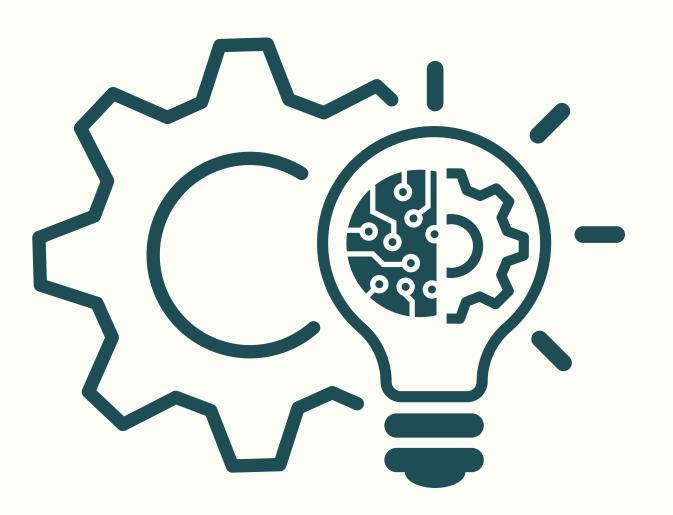

#### ChatGPT

- What is ChatGPT?
  - A Large Language Model designed for natural language processing
- Why ChatGPT?
  - Generates human-like proofs from natural language inputs
  - Provides an API that will be used for communication with Agda

### Research/Engineering Process

- Ol Algorithm
- 02 Diagrams
- 03 Challenges
- 04 Prototype

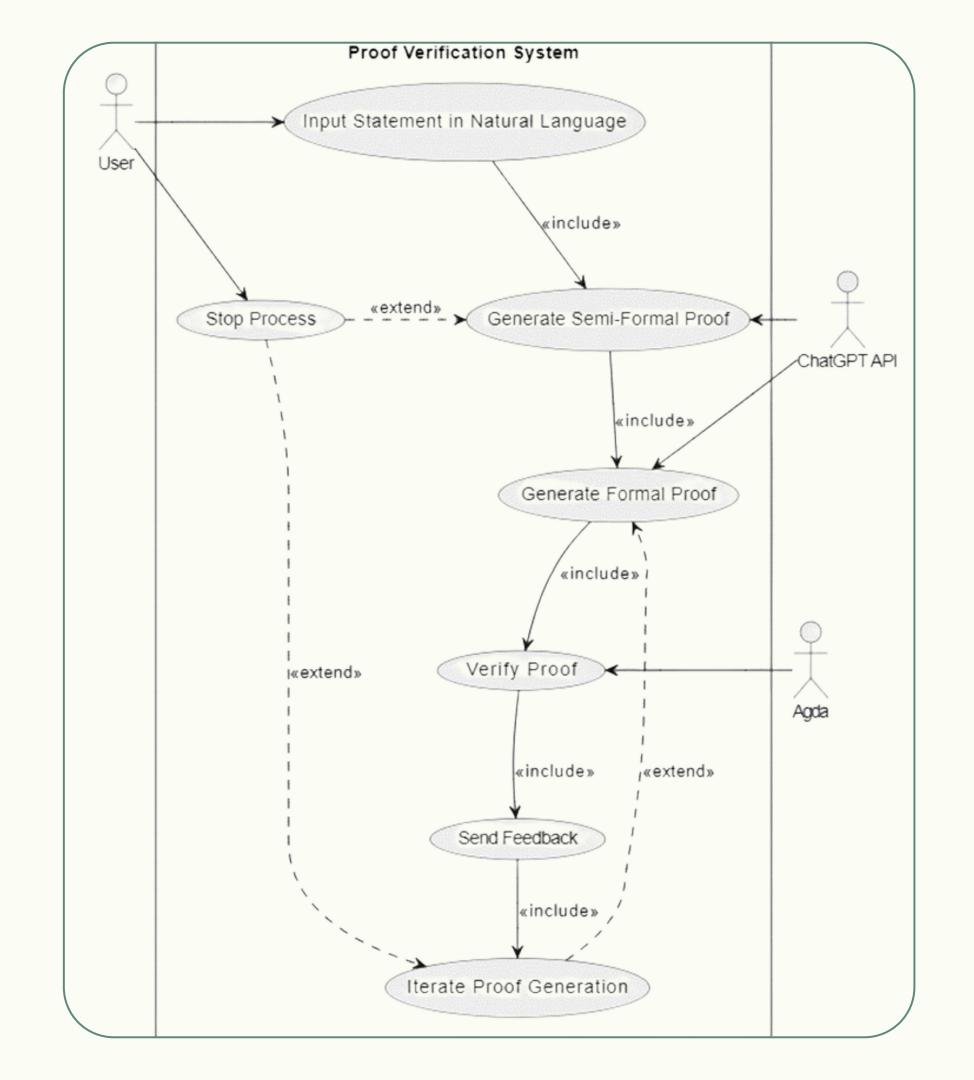

### Algorithm

Receive mathematical proof request from user ChatGPT generates mathematical proof Verify generated mathematical proof using Agda Refine proof Send feedback back to ChatGPT Display results

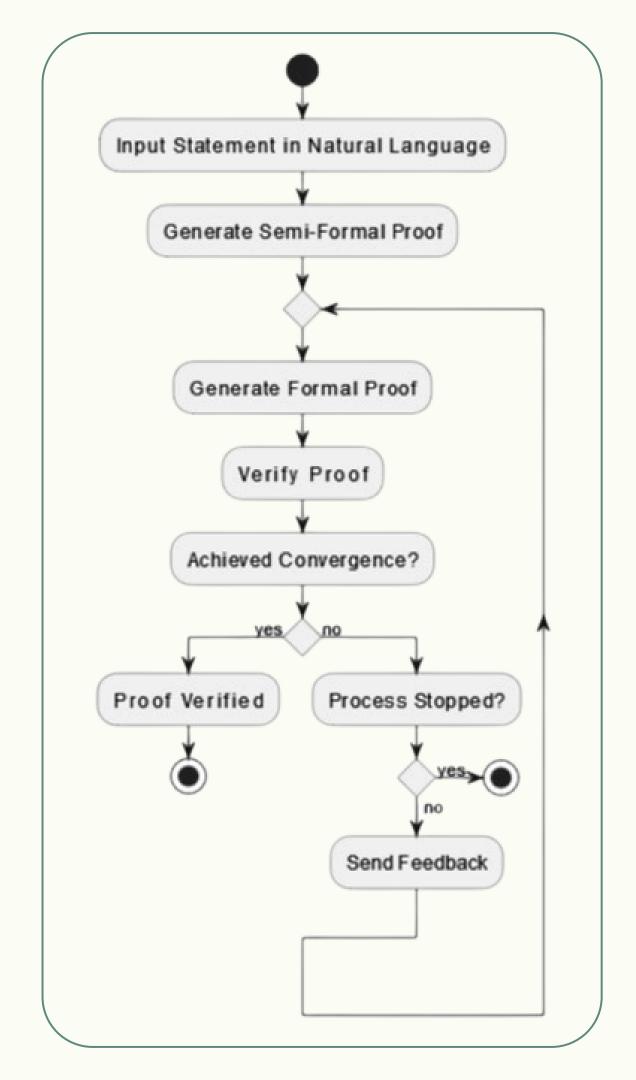

### Diagrams

**Use Case Diagram** 

#### Diagrams

**Activity Diagram** 

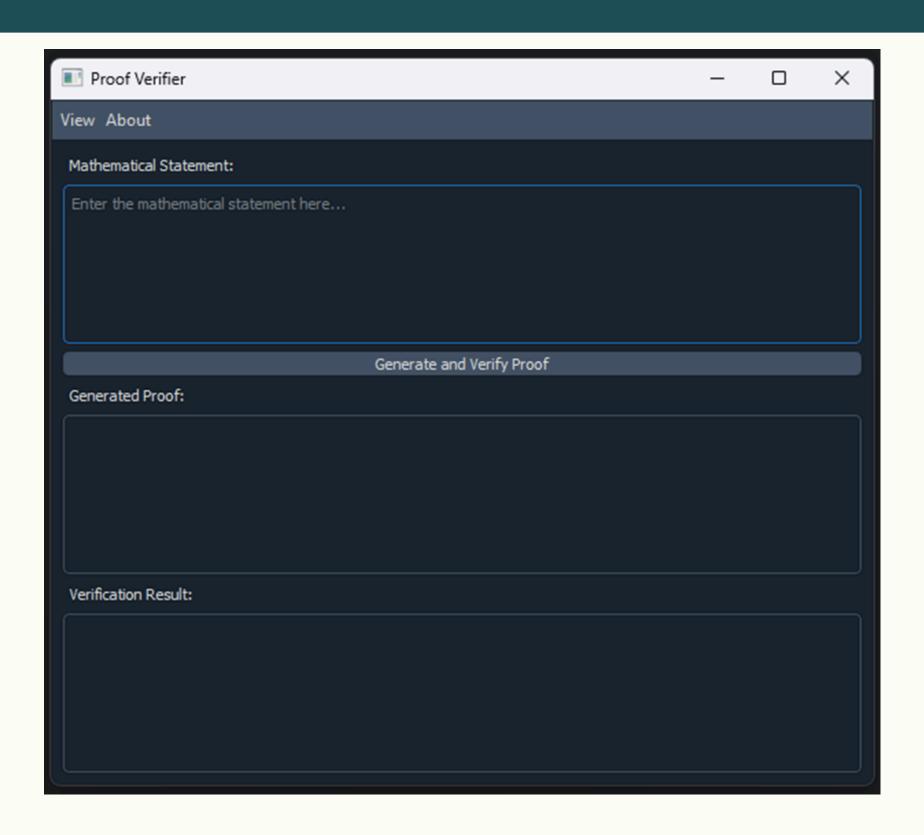

#### Challenges

- Non-Convergence
- Efficiency
- Smooth communication between ChatGPT and Agda
- Agda code

## Prototype

#### Verification Plan

Test Case	Test Case Description	Expected Outcome
1	Input a valid natural language mathematical statement into ChatGPT	ChatGPT generates a semi-formal proof, which is translated into Agda code for verification
2	Proof verification fails due to incorrect input	The system provides feedback, and ChatGPT refines the proof
3	Input a large and complex proof statement	The system efficiently handles the input and completes verification within an acceptable time-frame

#### Verification Plan

Test Case	Test Case Description	Expected Outcome
4	Attempt to verify an invalid or incomplete proof	The system detects the errors, provides feedback, and does not falsely confirm validity
5	User interrupts the iterative refinement process	The system safely halts the refinement process, saving the current state of the proof
6	The maximum duration of the iterative process is reached	The system safely halts the refinement process, saving the current state of the proof

### Expected Achievements

1

Successful Convergence of ChatGPT Generated Proofs

2

Increased Efficiency in Mathematical Proof Verification

3

Improved Trustworthiness of ChatGPT Generated Proofs

# Thank You for Listening!
